

Dudilig

Due diligence, continuously.

The AI-native compliance work platform for tokenized RWA issuers.

The compliance stack is the gate.

Every tokenized RWA offering touches 4-6 regulators across 3-5 jurisdictions. There is no software layer authorized to file on the issuer's behalf. So issuers pay \$300-500K per offering for human services to do what an authorized pipe could do for \$20K.

\$25B

On-chain RWA today (RWA.xyz, Q1 2026)

BUIDL, Franklin OnChain, Hashnote USYC, Ondo
OUSG dominate the top tier.

\$2T-\$16T

Forecast range by 2030

McKinsey lower bound; BCG/ADDX conservative
case (Sept 2022). Standard Chartered: \$30T by
2034.

\$300-\$500K

Per-offering compliance stack

Outside counsel, fund admin, KYC vendors,
sanctions, smart contract audit, Big Four. Annual
costs prorated against one launch.

The math: a \$5M offering loses 6% of the raise to compliance alone. A \$50M offering loses 0.6%. Below the ~\$30M floor, tokenization is uneconomic. The institutional tier (BUIDL, Hashnote, Ondo, Apollo, KKR) is tokenizing. The long tail is locked out.

AI agents do the work. The filing rail is what makes it permanent.

Three product surfaces today, deepening into a regulatory pipe over the next 18 months.

01 AI compliance work

Live in v1

- Issuance Agent: drafts Form D, PPM, and smart contract spec for new offerings
- Ongoing Compliance Agent: monitors KYC freshness and screens wallets continuously
- Attestation Engine: reads deployed contracts and proves on-chain matches off-chain claims
- Investor Q&A Agent: answers LP DDQs with full evidence chains

02 Direct regulatory filing

Sequenced months 6-18

- Month 9: MiCA disclosures via ESMA reporting API (first authorized filing path)
- Month 12: SEC Form D submission via EDGAR
- Month 18: Travel Rule messaging via IVMS 101
- Regulators trust the pipe, not the vendor on the other side. That's the switching cost

03 The Trust Certificate

One artifact, three audiences

- Publicly verifiable: no login, no contract, no Dudilig account required to read
- Cryptographically signed
- Embeddable on the offering page
- Three audiences: issuers share with LPs, LPs cite to their allocators, auditors build workflows around it

v1 sells the work. v2 owns the rail. Customers never switch products to get from one to the other.

Beachhead to platform.

The wedge is the long tail of issuers locked out by the compliance stack today, with a clear path into B2B2C and platform-tier accounts.

01 **\$200M**

Annual compliance spend across the tokenized RWA stack

Mid-market fund managers, TaaS platforms, boutique IBs, and HIP-3 deployers each carry \$200K–\$2M of recurring compliance cost. Combined SOM today, ~5x by 2028 as RWA volume compounds.

02 **\$25B**

On-chain tokenized RWA today (RWA.xyz, Q1 2026)

Up roughly 5x in three years. Concentrated in tokenized US Treasuries: BlackRock BUIDL (\$2.88B), Franklin OnChain, Hashnote USYC, Ondo OUSG. The institutional tier is live; the long tail is gated.

03 **\$2T–\$16T**

Forecast range by 2030

McKinsey lower bound. BCG/ADDX (2022) conservative case \$16T, upside \$68T. Standard Chartered \$30T by 2034. Even the lowest credible forecast implies two orders of magnitude of growth.

Sources: RWA.xyz Q1 2026 snapshot. BCG / ADDX, Relevance of On-Chain Asset Tokenization in 'Crypto Winter' (Sept 2022). McKinsey, From ripples to waves (2024). Standard Chartered tokenization forecast (2024).

Why now: five forces converging.

01 Capital + public markets

Securitize going public via Cantor SPAC at \$1.25B. BlackRock BUIDL \$2.88B. Tokenized US Treasuries exceed \$12B. Category crossed from speculative to investable.

02 MiCA filing rail

EU MiCA disclosures (Articles 9, 79, 88) are filed via machine-readable API. First AI-native filer becomes the cross-border pipe. SEC and MAS signaling in parallel.

03 AI maturity

Claude Opus 4.7 are production-ready for legal-grade reasoning. Schema-enforced JSON output makes verdicts auditable.

04 Research

IC3 (Cornell Blockchain Research Coalition) published the agentic blueprint: TxRay (planner + executable self-check), IMMACULATE (verifiable computation), Decompiling-with-LLM (unverified bytecode coverage).

05 Cost ceiling

\$300K to \$500K per offering is now the binding constraint on tokenization economics. Below ~\$50M raise size, the math no longer works.

The compliance OS for tokenized RWA does not exist. The category is being built right now.

Two moats compounding in parallel.

Five proprietary datasets no competitor can collect, plus the authorized filing rail no software vendor has built. Both structurally unavailable to incumbents.

01 Contract-to-compliance mapping

Every contract analyzed, paired with jurisdiction, claimed posture, and verified rule outcomes. Compounds attestation accuracy past any general-purpose model.

03 Attestation chain history

Every attestation is logged and hashed. Over months, we see how each issuer's compliance behavior changes - and we can flag warning signs before a real problem appears.

05 Cross-jurisdictional precedent

What CIMA accepted, MAS rejected, comment letters across six jurisdictions. The de facto multi-jurisdictional reference no single regulated incumbent will assemble.

02 Mismatch corpus (the gold dataset)

Cases where smart contracts didn't match their legal docs (e.g., 250-investor cap claimed, 500 enforced on-chain). Issuers can't build this - they'd be publishing their own mistakes.

04 KYC decision trails

Why investors were flagged, overridden, or confirmed during onboarding. Becomes a smarter risk scorer than off-the-shelf KYC tools - we learn from every override our customers make.

Buying the land above the oilfield. We capture the data at the point of compliance creation, before anyone else touches it.

Different category.

Adjacent players exist. None do AI-native compliance work and ship filings directly to regulators.

	AI-native	On-chain enforcement	Securities-law fluent	RWA-native	Vendor-agnostic	Authorized filing rail
Securitize	—	✓	✓	✓	—	—
Tokeny / T-REX	—	✓	✓	✓	—	—
Polymesh	—	✓	✓	✓	—	—
Vanta / Drata	—	—	—	—	✓	—
Chainalysis / Persona	✓	✓	—	—	✓	—
Dili (pivoted)	✓	—	—	—	✓	—
Dudilig	✓	✓	✓	✓	✓	Yes (m9-18)

The wedge: AI-native compliance work above any protocol stack - built for the CCO, not the issuance infrastructure. Today, the work. Tomorrow, the authorized filing rail.

Four motions, in parallel from week one.

Design partner depth, fund-manager speed, free-tier PLG, and a B2B2C anchor logo.

TRACK A — DEPTH

Design partner platform

InvestaX (Singapore, MAS-licensed)

Multi-issuer signal surface. 10-50 end-issuers worth of edge cases per design-partner relationship. Free or deeply discounted.

1 signed by month 3.

TRACK B — SPEED

Tokenized fund manager, \$100M–\$2B AUM

Hashnote, OpenEden, Backed Finance, Maple

Reg D 506(c) issuer with fresh trigger (post-Cooley, post-DDQ, planned launch in 90 days). Single-issuer integration, low engineering cost.

First \$5–10K MRR in week 4–8.

TRACK C — PLG

Free tier through HIP-3 deployers

Hyperliquid + Avantis + Ostium ecosystem

Public Trust Reports as the distribution surface. Singapore tokenization Telegram, Discord, X. No paid acquisition.

**100 free-tier accounts by month 6,
17% paid conversion.**

Usage-based pricing

Compliance work is variable. Issuance volume is variable. Every meaningful action consumes Dudilig Compliance Credits.

Tier	Credits / mo	Bundle	Effective \$/credit	Target ICP
Free	100	\$0	\$0	HIP-3, exploratory
Issuer	1K–5K	\$500–\$2K	~\$0.40	Fund managers (ICP 3)
Boutique	5K–15K	\$3K–\$7K	~\$0.30	Boutique IBs (ICP 4)
Platform	20K–100K	\$5K–\$25K	~\$0.25	TaaS platforms (ICP 2)
B2B2C	200K–500K	\$60K–\$150K	~\$0.20	Vertical B2B2C (ICP 1)
Enterprise	500K+	\$50K–\$300K+	~\$0.10	Fund admins, large platforms

83%

Gross margin at scale

17% of revenue covers AI inference cost.
Achievable via prompt optimization, batched inference, and routing cheaper actions to smaller models.

Same shape as Replit, Cursor, and Harvey: pay for outcomes, not seats. Revenue compounds with customer issuance volume rather than seat count, with $\geq 150\%$ NDR target as customers add token classes and jurisdictions.

30 / 60 / 90, then the path to \$10M+ ARR.

Each window is anchored to the IC3 research it productizes.

TODAY	DAYS 1-30	DAYS 31-60	DAYS 61-90	MONTHS 4-22
Demo prototype	Production foundation	Agentic core	Institutional credibility	Filing rail + scale
▪ dudilig.com with demo live ▪ Contract Analyzer calls Claude API on real Solidity ▪ Mock data on every other surface	▪ Live RPC reads (Polygon + Ethereum) ▪ Reproducibility pinning + tamper-evident audit log ▪ Stripe + Persona live ▪ InvestaX design partner signed	▪ Replatform Attestation Engine on TxRay topology ▪ MT-AgentRisk + ToolShield on Chat Agent ▪ 5 paying fund managers signed	▪ Multi-contract T-REX traversal ▪ Decompiling-with-LLM closed-source path ▪ IMMACULATE-style verifiable computation ▪ First B2B2C pilot integration	▪ Filing rail live: MICA (m9), EDGAR (m12), Travel Rule (m18) ▪ ~200 paying customers, \$10M+ ARR by month 24 ▪ Operationally profitable inside year 2 ▪ Strategic partnerships and acquirer conversations open

Capital efficiency: \$1.5M raise → \$10M+ ARR within 24 months → operationally profitable without bridge funding.

Built by people who have lived inside the regulation.

Hersh Malik

CEO / Co-founder

Coinbase • Morgan Stanley • Goldman Sachs • Columbia MBA

12 years in compliance and regulatory architecture inside the world's largest financial institutions. Director of Product at Morgan Stanley building AML / KYC infrastructure for Global Financial Crime. Executive Director at Goldman leading data governance for BCBS 239. Most recently launched Coinbase's broker-dealer subsidiary CCM.

Tung (Ken) Nguyen

CXO / Co-founder

QUOINE • Solana • Atlas Capital • Cornell Johnson MBA

Early builder (2018) at Quoine, the first globally licensed crypto exchange (Tokyo HQ, backed by Softbank's Taizo Son). Investor and contributor through Solana's first three years of growth. Venture Partner at Atlas Capital with active family-office relationships across APAC and the Middle East representing ~\$150B AUM. UC San Diego Jacobs Master's in Computer Systems Engineering.

IC3 Research Network

Cornell Tech • Stanford

Prospective Advisors: Ari Juels (Resilient Alerting), Liyi Zhou (TxRay, Decompiling-LLM), Lin William Cong (Cornell Johnson). IC3 Accelerator pathway under evaluation.

Founding Engineer (open)

Full-stack + integrations

Highest-priority hire post-funding. 1–2% equity. Owns Days 1–30 production foundation: live RPC reads, attestation hashes, Stripe, Persona, Trust Report URLs.

Fractional CCO (open)

ex-Big Four / ex-Securitize

Onboarded month 9, ~10 hours / month at ~\$5K. Hardens Layer 3 of Dudilig's own compliance posture before first paying customer signs.

Raising \$1.5M Pre-Seed.

a16z Speedrun lead. Coinbase Ventures co-investment as cap-table price floor.

USE OF FUNDS

40%	\$600K	Engineering and product Founding engineer + production build (Days 1–90). Infrastructure, APIs, attestation engine.
20%	\$300K	GTM and design partner InvestaX integration sprint; US fund-manager outreach (Track B); HIP-3 free tier launch.
20%	\$300K	Founder runway Ken & Hersh full-time post-funding at \$150K each.
10%	\$150K	Compliance posture Vanta, SOC 2 Type I audit, fractional CCO retainer, Tech E&O insurance.
10%	\$150K	Buffer Admin, trademark, contingency.

18-MONTH MILESTONES

- Design partner (InvestaX) live, case study published
- First \$5–10K MRR US fund-manager paying customer (week 4–8)
- 25–50 paying customers, \$250–500K MRR by month 12–18
- First B2B2C platform integration signed (month 9–12)
- SOC 2 Type I attested (month 9), Type II initiated (month 15)
- Operationally profitable inside year 2
- Strategic acquirer conversations open by month 18+

Due diligence,
continuously.
